VI. Wireframes

Main Navigation (Left Sidebar)

- **Purpose:** This is the primary navigation hub of the application. It provides the admin with persistent, one-click access to all major modules and functions of the HRMS. The inclusion of the admin's name and photo personalizes the experience.
- **Interaction:**
 - The admin clicks on links like **"Dashboard," "Employees,"** or **"Leave Management"** to navigate to the respective pages.
 - The **"Add Employees"** link is a direct path to the employee creation form.
 - The prominent **"Log Out"** button at the bottom provides a clear and secure way to end the session.

2. Header / Top Bar

- **Purpose:** The header provides top-level context and access to user-specific settings. The "Home" and "Dashboard" links act as breadcrumbs or primary navigation points.
- **Interaction:**
 - The admin can click the **Profile Avatar** (top right) to open the user settings menu.

3. User Settings Menu

- **Purpose:** This menu, revealed by clicking the profile avatar, gives the admin access to their personal account settings or allows them to log out. Separating user-specific

actions from main navigation is good practice.

- **Interaction:**
 - Clicking "**Account**" or "**Settings**" would take the admin to a page where they can change their password or update their profile information.
 - Clicking "**Logout**" securely ends the admin's session.

4. Quick Actions

- **Purpose:** This section perfectly addresses the need for efficient workflows by placing the most common and important administrative tasks front and center. It reduces the number of clicks required to perform key functions.
- **Interaction:**
 - Clicking "**Add New Employees**" will immediately take the admin to the form for creating a new employee profile. This is the primary "transaction" starting point.
 - Clicking "**View New Employees**" would likely navigate to the main employee list, but pre-filtered to show only employees hired within a recent timeframe (e.g., the last 30 days).

5. Summary Cards

- **Purpose:** These cards provide a high-level, "at-a-glance" overview of critical HR metrics. They allow the admin to quickly understand the current state of the workforce without needing to run detailed reports.
- **Interaction:**
 - Primarily, these are for viewing information quickly.
 - (*Potential Enhancement*): These cards could be made clickable. For example, clicking the "**On Leave Today**" card could navigate to a list showing exactly which employees are on leave.

6. Recent Employees List (Notifications/Activity)

- **Purpose:** This table serves as a specific and highly relevant notification feed. Instead of a generic bell icon, it shows concrete, recent activity—in this case, the latest additions to the company. This keeps the admin informed about workforce changes.
- **Interaction:**
 - The admin can scan the list to see the newest team members.
 - Clicking the "**View**" action button next to an employee's name will take the admin to that specific employee's detailed profile page.
 - The "**View All**" button provides an easy shortcut to the complete, unfiltered list of all employees in the system.

Add New Employee

Create a new employee account and set up their profile

Personal Information

Account Credentials

Employee Information

Cancel Create Employee Account

This entire page would be a single **Laravel Blade template** (e.g., `resources/views/employees/create.blade.php`). The form would use `method="POST"` and include the `@csrf` directive for security.

1. Personal Information

This section captures the employee's core personal data.

- **Form Elements:** Text inputs for *First Name*, *Last Name*, *Email Address*, *Phone Number*, *Address*, *City*, *State*, *ZIP Code*. Date picker for *Date of Birth* and a dropdown/select for *Gender*. Fields marked with an asterisk (*) are mandatory.
- **How it Works (Validation):**
 - Upon submission, Laravel's **Request Validation** will check these fields.
 - For example, rules in a `StoreEmployeeRequest` class would look like this:
 - `'first_name' => 'required|string|max:255'`
 - `'email' => 'required|email|unique:users,email'` (This is crucial to prevent duplicate accounts).
 - `'date_of_birth' => 'required|date'`
 - If validation fails, the user is redirected back to this page.

- **Laravel/Blade Support:**
 - The `old('first_name')` helper in Blade will repopulate the fields with the previously entered data, so the admin doesn't lose their work.
 - The `@error('first_name')` Blade directive will be used to display a specific validation error message next to or below each field that fails validation.
-

2. Employment Information

This section captures details specific to the employee's role within the company.

- **Form Elements:** Text inputs for *Employee ID*, *Position*, *Salary*. Date picker for *Joining Date*. Dropdowns for *Department*, *Employment Type*, and *Reporting To*.
 - **How it Works (Validation & Data Population):**
 - The dropdowns (*Department*, *Employment Type*, *Reporting To*) would be populated with data from the database. The controller method that displays this form (`EmployeeController@create`) would fetch these collections and pass them to the Blade view.
 - Validation rules would ensure data integrity:
 - `'employee_id' =>`
`'required|string|unique:employees,employee_id'`
 - `'department_id' => 'required|exists:departments,id'`
(Ensures the selected department actually exists in your database).
 - `'salary' => 'required|numeric|min:0'`
 - **Laravel/Blade Support:**
 - Inside the Blade template, a `@foreach` loop would iterate over the collections (e.g., `$departments`) passed from the controller to dynamically generate the `<option>` tags for each dropdown menu.
-

3. Account Credentials

This section handles the creation of the user's system account.

- **Form Elements:** Read-only fields for *Username* and *Temporary Password*. A *Note* providing instructions, and a *"Generate Credentials"* button.
- **How it Works (Backend Logic):**
 - These fields are "Auto-generated," meaning the admin doesn't fill them out. The logic for creating them resides entirely on the backend for security.
 - The **"Generate Credentials"** button could optionally use JavaScript to make an API call to pre-generate and display credentials, but the final, secure generation

happens upon form submission.

- The **Note** is static text that clearly informs the admin about the expected user experience for the new employee.
 - **Laravel Support:**
 - After the main form validation passes, the `EmployeeController@store` method will handle this logic:
 1. **Generate a username** (e.g., based on first and last name).
 2. **Create a secure, random temporary password** using Laravel's helper: `Str::random(12)`.
 3. **Hash the password** using `Hash::make()` before saving it to the `users` table. Never store passwords as plain text.
-

4. Submission and Feedback Process

This covers the final actions that complete the transaction.

- **Form Elements:** A "Cancel" button and a "Create Employee Account" submit button.
 - **How it Works (Controller & Redirection):**
 - The admin clicks "Create Employee Account".
 - The form data is submitted via a POST request to the route handled by `EmployeeController@store`.
 - The controller validates the data using the `StoreEmployeeRequest`.
 - If successful, the controller executes the logic to create the User and Employee records in the database.
 - The controller then dispatches a **Mailable** (e.g., `WelcomeEmployeeEmail`) to the new employee's email address, containing their username and temporary password.
 - Finally, the controller **redirects** the admin back to the employee list page with a success message.
 - **Laravel Support:**
 - The redirect is handled by return `redirect()->route('employees.index')->with('success', 'Employee John Doe has been created successfully!');`
 - On the employee list page (`index.blade.php`), a simple Blade conditional (`@if (session('success'))`) will display this "flash message" at the top of the page, providing clear, positive feedback that the transaction was completed.
-

VII. Task Analysis

1. Login and Dashboard Access

The Admin logs in with their credentials and is redirected to the main Dashboard, which shows summary cards and quick actions.

2. Initiating the Transaction (Add Employee)

The Admin clicks the "+ Add New Employees" button or the sidebar link to access the employee creation form.

3. Data Entry

The Admin fills out the new employee's personal and employment information in the form.

4. Form Submission and System Processing

The Admin clicks "Create Employee Account." The system validates the data. If successful, it creates the database records, generates credentials, and sends a notification email.

5. Confirmation and Feedback

The Admin is redirected to the employee list with a success message. The new employee now appears in the system.

6. Processing Payroll (Transactional)

- **Action:** The Admin navigates to the "Payroll Management" section via the sidebar. They select a pay period (e.g., October 1-15) and click "Initiate Payroll Run."
- **System Response (Calculation):** The system fetches all active employees and their data (salaries, approved overtime, unpaid leaves). It calculates gross earnings, standard deductions (like SSS, PhilHealth, Pag-IBIG contributions), and taxes to determine the final net pay for each employee.
- **User View:** The Admin is presented with a review table listing all employees and their calculated pay details.
- **Action (Review & Finalize):** The Admin reviews the calculations. They can make manual adjustments, such as adding a one-time bonus. Once satisfied, they click the "Finalize Payroll" button.
- **System Response (Confirmation):** The system commits all calculations to the database in a single transaction. It generates a payslip record for each employee and makes them available in the employee portal. The Admin sees a success message confirming the payroll has been processed.

VIII. Gantt Chart

Chapter 3

X. User Interface Manual

1. **Enter Credentials:** You will see a login form.
 - In the **Email Address** field, type the email associated with your admin account.
 - In the **Password** field, type your secure password.
2. **Access the System:** Click the **Login** button.

Upon successful authentication, you will be redirected to the Admin Dashboard. If your credentials are incorrect, an error message like "Invalid credentials" will appear.

The Admin Dashboard: Your Command Center

The Dashboard is the first screen you see after logging in. It's designed to give you a complete overview of key HR metrics and quick access to common tasks.

Main Interface Components

- **1. Navigation Sidebar (Left):** This is your primary tool for moving around the application. It contains links to all major modules:
 - **Dashboard:** Returns you to this main screen.
 - **Employees:** Takes you to the complete list of all employees.
 - **Add Employees:** A direct link to the employee creation form.
 - **Leave Management:** Where you can review and approve time-off requests.
 - **Documents:** Access employee-related documents.
 - **2. Header (Top):** The top bar contains navigation breadcrumbs and your user profile. Clicking your **Profile Avatar** in the top-right corner will open a menu to access your **Settings** or **Logout**.
 - **3. Quick Actions:** This section provides shortcuts to your most frequent tasks. Click the **"+ Add New Employees"** button to go straight to the main transaction form.
 - **4. Summary Cards:** These cards give you an at-a-glance view of important data, such as **Total Employees**, **New Hires**, and the number of staff **On Leave Today**.
 - **5. Recent Employees List:** This table acts as a notification feed, showing the most recently added employees, allowing you to quickly view their profiles.
-

Wireframes & UI Components

Main Navigation (Left Sidebar)

- **Purpose:** This is the primary navigation hub of the application. It provides the admin with persistent, one-click access to all major modules and functions of the HRMS. The inclusion of the admin's name and photo personalizes the experience.
- **Interaction:**
 - The admin clicks on links like "Dashboard," "Employees," or "Leave Management" to navigate to the respective pages.
 - The "Add Employees" link is a direct path to the employee creation form.
 - The prominent "Log Out" button at the bottom provides a clear and secure way to end the session.

2. Header / Top Bar

- **Purpose:** The header provides top-level context and access to user-specific settings. The "Home" and "Dashboard" links act as breadcrumbs or primary navigation points.
- **Interaction:**
 - The admin can click the Profile Avatar (top right) to open the user settings menu.

3. User Settings Menu

- **Purpose:** This menu, revealed by clicking the profile avatar, gives the admin access to their personal account settings or allows them to log out. Separating user-specific actions from main navigation is good practice.
- **Interaction:**
 - Clicking "Account" or "Settings" would take the admin to a page where they can change their password or update their profile information.
 - Clicking "Logout" securely ends the admin's session.

4. Quick Actions

- **Interaction:**
 - Clicking "Add New Employees" will immediately take the admin to the form for creating a new employee profile. This is the primary "transaction" starting point.
 - Clicking "View New Employees" would likely navigate to the main employee list, but pre-filtered to show only employees hired within a recent timeframe (e.g., the last 30 days).

5. Summary Cards

- **Purpose:** These cards provide a high-level, "at-a-glance" overview of critical HR metrics. They allow the admin to quickly understand the current state of the workforce without needing to run detailed reports.
- **Interaction:**
 - Primarily, these are for viewing information quickly.
 - (Potential Enhancement): These cards could be made clickable. For example,

clicking the "On Leave Today" card could navigate to a list showing exactly which employees are on leave.

6. Recent Employees List (Notifications/Activity)

- **Purpose:** This table serves as a specific and highly relevant notification feed. Instead of a generic bell icon, it shows concrete, recent activity—in this case, the latest additions to the company. This keeps the admin informed about workforce changes.
 - **Interaction:**
 - The admin can scan the list to see the newest team members.
 - Clicking the "View" action button next to an employee's name will take the admin to that specific employee's detailed profile page.
 - The "View All" button provides an easy shortcut to the complete, unfiltered list of all employees in the system.
-

"Add Employee" Form Breakdown

This entire page would be a single Laravel Blade template (e.g., `resources/views/employees/create.blade.php`). The form would use `method="POST"` and include the `@csrf` directive for security.

1. Personal Information

- **Form Elements:** Text inputs for First Name, Last Name, Email Address, Phone Number, Address, City, State, ZIP Code. Date picker for Date of Birth and a dropdown/select for Gender. Fields marked with an asterisk (*) are mandatory.
- **How it Works (Validation):** Upon submission, Laravel's Request Validation will check these fields. Rules like `'first_name' => 'required|string|max:255'` and `'email' => 'required|email|unique:users,email'` are enforced.
- **Laravel/Blade Support:** The `old()` helper repopulates fields on validation failure, and the `@error` directive displays specific error messages.

2. Employment Information

- **Form Elements:** Text inputs for Employee ID, Position, Salary. Date picker for Joining Date. Dropdowns for Department, Employment Type, and Reporting To.
- **How it Works (Validation & Data Population):** Dropdowns are populated from the database. Validation rules like `'department_id' => 'required|exists:departments,id'` ensure data integrity.
- **Laravel/Blade Support:** A `@foreach` loop in Blade generates the `<option>` tags for dropdowns from data passed by the controller.

3. Account Credentials

- **Form Elements:** Read-only fields for Username and Temporary Password.
- **How it Works (Backend Logic):** These fields are auto-generated by the backend upon successful form submission for security.

- **Laravel Support:** The `EmployeeController@store` method uses `Str::random(12)` to create a password and `Hash::make()` to secure it before saving.

4. Submission and Feedback Process

- **Form Elements:** A "Cancel" button and a "Create Employee Account" submit button.
 - **How it Works (Controller & Redirection):** The submit button sends a POST request. The controller validates, creates the User and Employee records, dispatches a welcome email (Mailable), and redirects back with a success message.
 - **Laravel Support:** The redirect is handled by `redirect()->route('...')->with('success', '...')`. A Blade conditional (`@if (session('success'))`) displays this flash message.
-

Task Analysis

1. Login and Dashboard Access

The Admin logs in with their credentials and is redirected to the main Dashboard, which shows summary cards and quick actions.

2. Initiating the Transaction (Add Employee)

The Admin clicks the "+ Add New Employees" button or the sidebar link to access the employee creation form.

3. Data Entry

The Admin fills out the new employee's personal and employment information in the form.

4. Form Submission and System Processing

The Admin clicks "Create Employee Account." The system validates the data. If successful, it creates the database records, generates credentials, and sends a notification email.

5. Confirmation and Feedback

The Admin is redirected to the employee list with a success message. The new employee now appears in the system.

6. Processing Payroll (Transactional)

- **Action:** The Admin navigates to the "Payroll Management" section via the sidebar. They select a pay period (e.g., October 1-15) and click "Initiate Payroll Run."
- **System Response (Calculation):** The system fetches all active employees and their data (salaries, approved overtime, unpaid leaves). It calculates gross earnings, standard deductions (like SSS, PhilHealth, Pag-IBIG contributions), and taxes to determine the final net pay for each employee.

- **User View:** The Admin is presented with a review table listing all employees and their calculated pay details.
 - **Action (Review & Finalize):** The Admin reviews the calculations. They can make manual adjustments, such as adding a one-time bonus. Once satisfied, they click the **"Finalize Payroll"** button.
 - **System Response (Confirmation):** The system commits all calculations to the database in a single transaction. It generates a payslip record for each employee and makes them available in the employee portal. The Admin sees a success message confirming the payroll has been processed.
-

User Interface Manual

Getting Started: Logging In

Enter your admin email and password on the login page and click "Login" to access the dashboard.

The Admin Dashboard: Your Command Center

The dashboard is your main hub, featuring the Navigation Sidebar, Header, Quick Actions, Summary Cards, and a Recent Employees list.

Performing the Main Transaction: Adding a New Employee

- **Navigation:** Click "+ Add New Employees" from the dashboard or sidebar.
- **Interaction:** Fill out the multi-section form with the new hire's details.
- **Submission:** Click "Create Employee Account." You'll receive a success notification upon completion or error messages if corrections are needed.

Processing Payroll

- **Navigation:** From the sidebar, click on **"Payroll Management"**.
- **Interaction:**
 1. On the Payroll Dashboard, select the correct pay period and click the **"Run Payroll"** button.
 2. You will be taken to a review screen. Carefully check the table of auto-calculated salaries, deductions, and net pay for each employee.
 3. Make any necessary adjustments (e.g., add a performance bonus in the provided input field).
 4. Click the **"Finalize Payroll"** button to complete the transaction.
- **Confirmation:** A success banner will confirm that the payroll has been processed. Payslips will now be available for employees to view.

Generating Reports & Viewing Lists

Navigate using the sidebar to view lists of Employees, Leave Requests, etc. Use the search bars to filter and the "View" buttons to see detailed information.

XI. Feature Highlights

Secure Authentication & Role-Based Access

- **User Benefit:** It provides critical **security** and **data privacy**. The system clearly separates administrator and employee roles, preventing unauthorized access to sensitive employee information and critical system functions.
 - **Laravel Implementation:**
 - **Authentication:** Laravel's built-in authentication system handles the secure login process, password hashing, and session management.
 - **Middleware:** Route protection is handled by middleware. An auth middleware guards all authenticated pages, while a custom IsAdmin middleware is applied to administrator-only routes to check the role column on the users table.
-

2. Centralized Admin Dashboard

- **User Benefit:** It dramatically **improves workflow efficiency**. Instead of navigating through multiple menus, admins get an instant snapshot of key metrics and can initiate the most common task—adding a new employee—with a single click.
 - **Laravel Implementation:**
 - **Eloquent ORM:** The controller for the dashboard uses Eloquent to make simple, readable database queries to fetch the summary data.
 - **Blade Templates:** The dashboard is a Blade template that receives data from the controller. Reusable UI elements are built as Blade components.
-

3. Core Employee Management

- **User Benefit:** It creates a **single source of truth** for all employee data, streamlining the onboarding process and making information retrieval effortless.
 - **Laravel Implementation:**
 - **Eloquent Models & Relationships:** User, Employee, and Department models define the database structure and relationships for intuitive data handling.
 - **Request Validation:** Form Request classes contain all the validation logic for new employee submissions, keeping controllers clean.
 - **Blade Forms:** The "Add New Employee" form uses the @csrf directive for security, the old() helper to repopulate form data on error, and the @error directive to display messages.
-

4. Leave Management System

- **User Benefit:** It replaces inefficient manual processes with a formal, **transparent, and trackable** system for time-off requests.
 - **Laravel Implementation:**
 - **Eloquent Relationships:** The Employee model's one-to-many relationship with LeaveRequest makes it simple to fetch all requests for a given employee.
 - **Mailables:** Laravel's Mailable classes are used to automatically dispatch notification emails to employees about the status of their requests.
-

5. Transactional Payroll System

- **User Benefit:** It **automates the complex and error-prone** task of calculating payroll, ensuring employees are paid accurately and on time. It also provides employees with easy access to their payslips, fostering transparency.
- **Laravel Implementation:**
 - **Database Transactions (DB::transaction):** Used when finalizing a payroll run to ensure all database writes (payslips, earnings, deductions) complete successfully as a single operation, preventing data corruption.
 - **Queues & Jobs:** For larger companies, the payroll calculation can be dispatched as a background job to prevent UI timeouts and ensure a smooth admin experience.
 - **PDF Generation:** A library like Laravel DomPDF is used to generate downloadable, professional payslips for each employee.
